Chapter 1 Safety Information and Precautions

1.1 Safety Information

Please read this chapter carefully while installing and commissioning the inverter and be sure to follow the safety precautions required in this chapter. We will assume no liability or responsibility for any injury or loss caused by improper operation.

In this manual, safety precautions are classified into the following two categories:

Indicates there is a risk of electric shock, which may cause equipment damage or personal injury if not avoided.

Warning

Indicates potential risks, which could result in equipment damage or property loss if not avoided

Danger

- ★Do not install the equipment if you find water seepage, component missing or damage upon unpacking!
- ★Do not use the strip to supply power to the inverter.
- ★Do not conduct any high voltage insulation and withstand voltage test.

Danger

- ★Before touching the inverter, disconnect the power supply; After power off, terminal and internal will exist high pressure for ten minutes, during when don't touch any input/output terminals.
- ★Rotating motor may feed electrical energy back to the inverter, before touching it, please ensure that the motor has stopped, or disconnected with the inverter.
- ★Before connecting the cable, make sure there is no voltage at the power terminal.
- ★Ground the inverter as standard. The ground wire must be able to withstand the maximum fault current limited by the fuse or circuit breaker.
- ▲ Handle the equipment with care during transportation.
- ▲ Keep away from combustibles and electrical conductors.
- ▲ Inverters are best used indoors, IP20 inverters must be installed in a level 2 pollution environment or in the cabinet of the IP54 and higher level of protection.
- ▲ Ensure adequate heat dissipation while installing the inverter and do not drill holes near it, for drilling dust and metal debris could fall into the inverter, which may lead to danger.
- ▲ Do not drop wire end or screw into the inverter.
- ▲ Never connect the power cables to the output terminals (U, V, W) of the inverter.

- ▲ When the control cable is near the power line, keep a minimum spacing of 100 mm and arrange a 90-degree crossover. Make sure all the terminals have been fastened using the appropriate torque.
- ▲ If the enable input signal is valid, the driven motor may start directly after being powered
- ▲ Ensure that the supply voltage, frequency and phase are in accordance with the inverter
- ▲ When motor autotune, pay attention that the motor may rotate, which may cause danger.
- ▲ The inverter can control the motor to run above or below the rated speed. When needing

the motor to run overrated speed, you can confirm whether it is feasible with motor manufacturers.

- ▲ Do not power on or off the inverter frequently, which may be easy to shorten its service life. Please power on again ten minutes after power off.
- ▲ In the area with an altitude of more than 1000m, derating is required.
- ▲ Do not try to repair the inverter when errors and faults occur. Contact us for more help.

1.2 General Precautions

1. Requirement on Residual Current Device (RCD)

The inverter generates high leakage current during running, which flows through the protective earthing (PE) conductor. Thus install a type-B RCD at primary side of the power supply. When selecting the RCD, you should consider the transient and steady-state leakage current to ground that may be generated at startup and during running of the inverter. You can select a specialized RCD with the function of suppressing high harmonics or a general-purpose RCD with relatively large residual current.

2. Motor Insulation Test

Perform the insulation test when the motor is used for the first time, or when it is reused after being stored for a long time, or in a regular check-up, in order to prevent the poor insulation of motor windings from damaging the inverter. The motor must be disconnected from the inverter during the insulation test. A 500V mega-Ohm meter is recommended for the test. The insulation resistance must not be less than 5 $M\Omega$.

3. Thermal Protection of Motor

If the rated capacity of the motor selected does not match that of the inverter, especially when the inverter's rated power is greater than the motor's, adjust the motor protection parameters on the operation panel of the Inverter or install a thermal relay in the motor circuit for protection.

4. Running at Over 50 Hz

The inverter provides frequency output of 0 to 500 Hz. If the inverter is required to run at over 50 Hz, consider the capacity of the mechanical devices.

5. Vibration of Mechanical Device

The inverter may encounter the mechanical resonance point at some output frequencies, which can be avoided by setting the skip frequency.

6. Motor Heat and Noise

The output of the inverter is pulse width modulation (PWM) wave with certain harmonic frequencies, and therefore, the motor temperature, noise, and vibration are slightly greater than those when the inverter runs at grid power (50 Hz).

7. Varistor or capacitor on output side of the Inverter

Do not install the capacitor for improving power factor or lightning protection voltage-sensitive resistor on the output side of the inverter because the output of the inverter is PWM wave. Otherwise, the inverter may suffer transient over-current or even be damaged.

8. Contactor at the I/O Terminal of the Inverter

When a contactor is installed between the input side of the inverter and the power supply, the inverter must not be started or stopped by switching the contactor on or off. If the inverter has to be operated by the contactor, ensure that the time interval between switching is at least one hour since frequent charge and discharge will shorten the service life of the capacitor inside the inverter.

When a contactor is installed between the output side of the inverter and the motor, do not turn off the contactor when the inverter is active. Otherwise, modules inside the inverter may be damaged.

9. When External Voltage is Out of Rated Voltage Range

The inverter must not be used outside the allowable voltage range specified in this manual. Otherwise, the inverter's components may be damaged. If required, use a corresponding voltage step-up or step-down device.

10. Prohibition of Three-phase Input Changed into Two-phase Input

Do not change the three-phase input of the inverter into two-phase input. Otherwise, a fault will result in, or the inverter will be damaged.

11.Lightning Shock Protection

The inverter has a built-in lightning overcurrent protection device, it has certain self-protection ability for inductive lightning. But user should also install lightning protection device at the front end of the inverters in frequent lightning area.

12. Temperature and De-rating

The regular using temperature of this inverter is -10°C- +40°C. De-rating using is required when temperature is more than 40°C. De-rating by 1.5% for every degree increase in ambient temperature. The highest ambient temperature is 50°C.

13. Altitude and De-rating

In places where the altitude is above 1000m and the cooling effect reduces due to thin air, it is necessary to de-rate the inverter. When the altitude is above 1000m, de-rating by 1% for 100m increase in altitude. The highest altitude is 3000m.

14. Some Special Usage

If the user needs to use a method other than the recommended wiring diagram in this manual, such as shared DC bus, please consult us.

15.Scrap

The electrolytic capacitors on the main circuits and PCB may explode when they are burnt. Poisonous gas is generated when the plastic parts are burnt. Please treat them as industrial waste.

16.About Adaptable Motor

- The default setting of this inverter is for the 4-pole cage asynchronous induction motors. For other types of motors, select proper parameters in the inverter.
- The cooling fan and rotor shaft of non-variable-frequency motor are coaxial, which results in reduced cooling effect when the rotational speed declines. If variable speed is required, add a more powerful fan or replace it with variable-frequency motor in applications where the motor overheats easily.
- The standard parameters of the adaptable motor have been configured inside the inverter. It is still necessary to perform motor auto-tuning or modify the default values based on actual conditions. Otherwise, the running result and protection performance will be affected.
- The inverter may alarm or even be damaged when short-circuit exists on cables or inside the motor. Therefore, perform insulation short-circuit test when the motor and cables are newly installed or during routine maintenance. During the test, make sure that the inverter is disconnected from the tested parts.

Chapter 2 Product Information

Our inverters have been tested and inspected before leaving our factory. Before unpacking the product, please check product packaging for shipping damage caused by careless transportation and whether the specifications and type of the product complies with the order. If there is any question, please contact the supplier of the products, or directly contact us.

2.1 Products Nameplate

900 series inverters are named following rules below:

2.2 Products Model Number

900M, Single Phase Input: 200~240V±10%, Three Phase Input: 380~480V±10%, 50/60Hz						
Adapted	motor	Rated output	Fromo

^{*}Due to Product upgrade, size update without prior notice, Consult staff for details.

2.4 Technical Specifications

Item		Specifications			
	Maximum Frequency	Vector Control: 0~500Hz V/F Control: 0~500Hz			
	Carrier Frequency	0.5kHz~16kHz; the carrier frequency will be automatically adjusted according to the load characteristics.			
Basic Functions	Input Frequency Resolution	Digital Setting: 0.1Hz Analog Setting: 0.01V corresponding maximum frequency ×0.1%			
	Control Mode	Open Loop Vector Control(SVC); V/F Control			
	Startup Torque	0.5Hz/150%(SVC);			
	Speed Range and Precision	1: 100(SVC); ±0.5%(SVC)			
	Overload Capability	150% rated current 60s ; 180% rated current 3s			
	Torque Boost	0.1%~30.0%			
	V/F Curve	Line Type Square Type			
	Acc. / dec Curve	Straight line or S curve acceleration and deceleration mode Acceleration and deceleration time range between 0.0 to 500.0s.			
	DC Brake	DC Brake Frequency: 0.00Hz to maximum frequency. Brake time: 0.0s to 36.0s			
	Multi-speed Running	It can realize at maximum of 4 segments speed running via the control terminal.			
Basic	Built-in PID	It is easy to realize process-controlled closed loop control system.			
Functions	Over-voltage/current Stall Control	It can limit the running voltage/current automatically and prevent frequent over-voltage/current tripping during the running process.			
	Motor Over-temperature Protection	Acceptable motor temperature sensor input (PT100, PT1000)			
	Timing Control	Timing control function: set time range 0.0~6500.0Min			
	Bus Support	Support Site Bus: Modbus			
	Protection Function	It can implement power-on motor short-circuit detection, output phase loss protection, over current protection, over voltage protection, under voltage protection, overheating protection and overload protection, which can be turned on or shielded as required.			

	Item	Specifications
	Running Command	Operation panel reference, control terminal reference, and
	Source	communication reference
		Digital reference, analog signal reference, multi-segment
	Target Frequency Source	speed reference, PI control reference, and communication
		reference
Running	Control Signal Input	5 digital input;
	Terminal	2 analog input, support 0~10V、4~20mA、0~20mA、20~0mA、
	Terrinia	20~4mA and 10~0V signal
	Control Signal Output	1 relay output, 2 analog input.
	Terminal	2 analog output, support 0~10V、4~20mA、0~20mA、
		20~0mA \ 20~4mA and 10~0V 0~20mA signal
	Using Place	Indoor, and be free from direct sunlight, dust, corrosive gas,
	Oshing Flace	combustible gas, oil smoke, vapor, drip or salt.
	Altitude	0~4000m; Derating use when more than 1000m (decrease
	Aititude	by 1% per 100 meters)
	Ambient Temperature	-10 $^\circ\!$
	Ambient remperature	temperature of 40 $^\circ\!$
Environme	Humidity	Less than 95%RH, without condensing
nt	Vibration	Less than 5.9m/s (0.6g)
	Storge Temperature	−20 °C~+60°C
	IP Level	IP20
	Pollution Level	PD2
	Power Distribution	TN, TT
	System	114, 11

2.5 Brake Chopper & Brake Resistor List

\/oltogo(\/\	Invertor Dower(KM)	Brake Chopper Specification		\/oltogo(\/)
Voltage(V)	Inverter Power(KW)	W	Ω	Voltage(V)
Cingle Dhase	0.75	80	150	
Single Phase 220V	1.5	100	100	Single Phase 220V
2200	2.2	100	70	
	0.75	150	300	
	1.5	150	220	
Three Phase	2.2	250	200	Three Phase 380V
380V	4.0	300	130	Three Phase 380V
	5.5	400	90	
	7.5	500	65	

Note: models above 5.5KW need external brake unit. Contact the supplier for more information.

Chapter 3 Mechanical Installation and Electrical Installation

3.1 Mechanical Installation

3.1.1 Installation Environment Requirements

- 1) The inverter should be installed vertically and fixed on the mounting support or smooth plane with screws.
- 2) Ensure that the installation environment meets the environmental requirements in Section 2.5.
- 3) Keep away from combustibles and areas where water may drench and have enough space around it for heat dissipation.

3.1.2 Installation Clearance Requirements

The clearance that needs to be reserved varies with the power class of the inverter, as shown in the following figure:

Figure. 3.1.2.1 Installation clearance requirements on the inverters of different power classes:

Power Class	Clearance Requirements(mm)		
0.75kW~22kW	A≥10 B≥200		
30kW~37kW	A≥50	B≥200	
45kW~110kW	A≥50	B≥300	

Heat dissipation of inverter is distributed from bottom to top. When multiple inverters work, they are usually installed side by side. In the case of upper and lower row installation, the heat of lower row inverter will cause the temperature rise of upper row equipment and lead to failure, so measures such as

installation of heat insulation guide plate should be taken.

3.1.3 Routine Maintenance

- (1) Environmental temperature must be kept within the limits set out in Section 2.5.
- (2) The radiator fan must rotate easily and be free from dust.
- (3) The cabinet in which the inverter is installed should be free of dust and condensation, and the ventilation fan and air filter should work properly to ensure adequate airflow.

3.2 Electrical Installation

3.2.1 Inverter Main Loop Terminal

Mark	Terminal Name	Function Description		
	Three Phase Power	AC input three-phase power connection point, for		
R、S、T	Input Terminal	single phase inverter, connect R、S terminal.		
11 1/ 14/	Inverter Output	Connect three phase motors.		
U、V、W	Terminal			
D(1) DD(1)	External Brake	External Brake Resistor		
P(+)、PB(-)	Terminal	External prake nesistor		
후	Earth Terminal PE	Earth Terminal		

3.2.2 Caution of Power Terminal Wiring

1)Input Power R、S、T:

- Inverter input side connection, no phase sequence requirements.
- The specifications and installation methods of the external power wiring should comply with the local regulations and related IEC standards.
- Please refer to the following table for power cable wiring:

Inverter Model		Recommended Breaker Specifications	Recommended Contactor Specification	Recommended Input Power Cable (m²)	Recommended Motor Cable(m²)	Recommended Control Cable(m²)
Single 22	0.75KW	16	10	2.5	2.5	1.5
gle Ph 220V	1.5KW	20	16	4	2.5	1.5
Phase 0V	2.2KW	32	20	6	4	1.5
#	0.75KW	10	10	2.5	2.5	1.5
Three	1.5KW	16	10	2.5	2.5	1.5
Ph	2.2KW	16	10	2.5	2.5	1.5
Phase	4KW	25	16	4	4	1.5
380V	5.5KW	32	25	6	6	1.5
>	7.5KW	40	32	6	6	1.5

Caution of terminal wiring:

1. Inverter input side:

▲ Three-phase power supply should be connected to R, S, T terminal, do not have to consider the phase sequence; Single-phase power supply (220V model) should be connected to the R and S terminal.

▲ Proper protection devices installed on input and distribution lines should comply with local safety regulations.

▲ Protection can be provided by installing a suitable fuse at the power supply entry line. Fuses used must comply with local regulations.

▲ Residual high voltage exists at terminals of DC bus DC+ and DC- after power off. Therefore, power off for 10 minutes before wiring.

2. Inverter output side:

▲ Capacitor or surge absorber cannot be connected to the output side of the inverter, Otherwise, inverter protection or even damage will be caused.

▲ The selection of brake resistance should refer to the recommended value, and the wiring distance should be less than 5m.

▲ When the length of motor cable is more than 100m, AC output reactor should be installed near the inverter.

▲ In order to reduce the interference of inverter output to other equipment, it is recommended to use shielded cable for motor cable.

▲ Motor terminal box connection: Most general-purpose motors can operate at dual voltages, as indicated on the motor nameplate. The operating voltage of the motor is usually selected when the motor is installed, star connection or angle connection. The star connection is usually the one with the highest voltage rating.

Motor Input Voltage	Motor Nameplate Voltage	Мо	otor Wiring Mode
230 VAC	230/400 VAC	Dalla	DELTA A
400 VAC	400/690 VAC	Delta	
400 VAC	230/400 VAC	Star	STAR A

3.2.3 Description of Control Terminals

Description of Control Terminals of mini type inverter:

TA	ТВ	DC	ΑI	DI1	DI2	DI3	DI4	GND	АО	S+	S-	
----	----	----	----	-----	-----	-----	-----	-----	----	----	----	--

*S+ S- is for external expansion, not standard;

Description of Control Terminals of general type inverter:

NC	NC1	DI1	DI2	DI3	DI4	DI5	S-	S+	AI1	AO1
TA	ТВ	TC	DO1	СОМ	DO2	24V	AO2	GND	AI2	10V

^{*}NC NC1 is a non-standard function and needs to be produced according to the order requirements.

Control Terminals Description:

Туре	Terminal	Terminal Name	Function Description		
Power Output	+10V-GND	Terminal of 10V power output	Provide +10V power supply for external units, with maximum output current of 10mA. It is generally used as the operating power supply for the external potentiometer. The potentiometer resistance range is $1-5k\Omega$.		
Analog Innut	AI1-GND	Analog input terminal 1	F0-07 set voltage and current mode.		
Analog Input	AI2-GND	Analog input terminal 2	F0-07 set voltage and current mode.		
	DI1-COM	Digital Input 1			
Digital	DI2-COM	Digital Input 2	1. Optical coupling isolation,bipolar input.		
Digital Input	DI3-COM	Digital Input 3			
Input	DI4-COM	Digital Input 4			
	DI5-COM	Digital Input 5			
Analog	AO1-GND	Analog output	F0-07 set voltage and current mode.		
Output	AO2-GND	Analog output	F0-07 set voltage and current mode.		
Digital	DO1-COM	Digital output	Optical coupling isolation, dual polarity open collector output. Output voltage range: 0-24V.		
Output	DO2-COM	Digital output	Optical coupling isolation, dual polarity open collector output. Output voltage range: 0-24V.		
Dolov Costracit	T/B-T/C	Normally closed	Contact driving capacity: 250Vac, 3A;		
Relay Output	T/A-T/B	Normally open	30Vdc, 1A		
485 Communicati on Interface	S+/S-	485 communication interface	Respectively are the positive end of 485 differential signal and the negative end of 485 differential signal (reference ground: GND). Standard 485 communication interface, please use twisted pair or shielded cable.		

3.2.4 Terminal Wiring Diagram

Mini type three-phase 380V terminal wiring diagram:

*s+/s- need to be connected with an external RS485 module.

General type three-phase 380V terminal wiring diagram:

^{*}NC NC1 is not standard function, production depends on purchasing order.

^{*0.75~5.5}KW built-in braking unit, external braking resistor connected to P and PB terminals.

^{*}Inverter above 5.5KW/380V need to be connected with an external braking unit.

Chapter 4 Keypad and Display Operation

4.1 General Type Operation Panel

You can modify the parameters, monitor the working status, and start or stop the inverters by operating the panel.

Operation Panel Diagram (General Type 900G)

Function Indicator Description:

FWD: Forward Running Indicator REV: Reverse Running Indicator

STOP: Stop Indicator ALARM: Fault Indicator

4.1.1 General Type Keyboard Function Description(900G)

1.1 General Ty	.1 General Type Reyboard Lanction Description(2000)					
Key Sign	Name	Function Description				
PRGM	Program/Enter	Long press more than 3 seconds enter/back main menu. Press to read /write parameter.				
A	Increase	Increase the data or the function code.				
•	Decrease	Decrease the data or the function code.				
<<	Shift	Select the parameter modification and display content.				
RUN	Run	Panel start.				
STOP	Stop/Reset	Stop/reset operation.				

4.1.2 Mini Type Operation Panel (900M 0.75-2.2KW)

Operation Panel Diagram (Mini Type 900M)

Running Indicator: Light on when inverter is running; light off when inverter stops.

LOCAL/Remote mode indicator: Light off when local speed adjustment; light on when remote speed adjustment.

FWD/REV: Light off when inverter is forward running; Light on when inverter is reverse running.

4.1.3 Mini Type Keyboard Function Description (900M 0.75-2.2KW)

Key Sign	Description	Key Sign	Description
RUN	Running indicator: Frequency converter running often bright; Extinguish when it stops.		Increase the number upward.
LOCAL REMOT	Local/remote mode indicator: When the local speed is off; Remote speed control often bright.	•	Decrease the number downward.
FWD REV	Forward/reverse indicator light: Extinguish at positive turn; Inversion often bright; .	RUN	In panel control mode, for running operation.
PRGM	Enter the parameter interface from the main interface or return.	STOP	Stop operation; Or fault reset operation.
ENTER	Save or modifying parameters.	REV	In panel control mode, it is used for reverse and jog switching.
>>	Switch between interfaces; Or switch the number of digits.		

4.1.4 General Type Panel Operation

(1) Running and stopping

The default mode is the panel control mode (parameter F0-00 = 0). The Run key run the inverter and the STOP key controls the inverter to stop. When the inverter is running, the main interface display frequency value; When the inverter stops, the frequency value flashes.

(2) Switching running interface

When the inverter is running, the screen displays the main interface by default. At this time, press the very, and the screen will switch among various operating interfaces, starting with the output frequency, and then displaying the motor speed, output voltage, output current and output power in turn. Examples are shown in the following figure.

(3) Parameter switching

When displaying main interface, press "PRGM" to enter the first-level menu interface, and then select the parameter group you want to access through "Up/Down" in the first-level menu interface; Press "ENTER" to enter the second-level menu interface from the first-level menu interface, where you can select the parameters which can be modified. Press "ENTER" again, and you will enter the third-level menu interface from the second-level menu interface. At this time, you can check or modify the value of this parameter.

When the inverter displays the third-level menu interface, you can press "PRGM" or "ENTER" to return to the second-level menu interface but pressing "PRGM" will not save the modified parameters, only pressing "ENTER" will save the parameters. When the inverter displays the first-level menu interface, press "PRGM" to return to the main interface.

(4) Selection of parameters

When the second-level menu interface is displayed, press "Up" or "Down" to switch the parameters you want to access.

The inverter also has monitoring parameters. The way to view them is to find U0 in the first-level menu interface, and then press "ENTER" to enter the monitoring parameter access interface.

(5) Reset parameters

The parameter F0-24 can be used to reset the parameter. The default value of F0-24 is 0. Change it to 1 and press "ENTER". You can reset the parameters to factory default values.

4.2 Cases Study

4.2.1 Inverter Three-wire Setting

0: Two-wire mode 1: (Mini type 900M)

TA TB DC AI DI1 DI2 DI3 DI4 GND AO S	+ S-
--------------------------------------	------

Parameter settings:

F0-00=1 (external terminal control)

F1-06=1 (Two-wire type 1)

F1-00=1

F1-01=2

In this control mode, DI1 and GND are turned on, and the inverter is running forward; DI2 and GND are turned on, and the inverter runs in reverse.

1: Two-wire mode 2: (Mini type 900M)

Parameter settings:

F0-00=1 (external terminal control)

F1-06=1 (Two-wire type 2)

F1-00=1

F1-01=2

In this control mode, when DI1 and GND are turning on, and the inverter is running forward; When DI1 and GND are on, DI2 and GND are on, and the inverter runs in reverse.

2: Three-wire mode 1: (Mini type 900M)

Parameter settings:

F0-00=1 (External terminal control)

F1-06=2 (Three-wire type 1)

F1-00=1

F1-01=2

F1-02=3

In this control mode, when DI3 and GND are turned on, DI1 and GND are turned on, and the inverter

runs in a forward direction; When DI3 and GND are on, DI2 and GND are on, and the inverter runs in reverse. During normal start-up and operation, DI3 and GND must be conducted, and the commands of DI1 and DI2 will take effect at the edge of conducting action. The running state of the inverter will be subject to the last key action of these three switches.

3: Three-wire mode 2: (Mini type 900M)

Parameter settings:

F0-00=1 (External terminal control)

F1-06=3 (Three-wire type 2)

F1-00=1

F1-01=2

F1-02=3

In this control mode, when DI3 and GND are turned on, DI1 and GND are turned on, and the inverter runs in a forward direction; When DI3 and GND are turned on and DI1 and GND are turned on, turn DI2 and GND on, and the inverter will run in reverse. During normal startup and operation, DI3 and GND must be kept on, and the command of DI1 will take effect as soon as it is turned on.

4.2.2 Multi-speed settings (mini type 900M)

Parameter settings:

F0-00=1 (external terminal control)

F0-01=4 (Frequency source is selected as multi-speed)

F1-00=1 (DI1 terminal connected to external switch K)

F1-01=8 (DI2 terminal connected to external switch K1)

F1-02=9 (DI3 terminal connected to external switch K2)

F1-03=10 (DI4 terminal connected to external switch K3)

Parameter group F1 defines multi-segment speed function, 8 represents multi-segment command 1,9 represents multi-segment command 2, and 10 represents multi-segment command 3, 3 terminals can be

combined into 8 speed segments, and the frequency values of 8 speed segments can be set by F4-01~F4-08 respectively, and the corresponding truth table is as follows:

К3	K2	K1	Command Setting	Corresponding parameters
OFF	OFF	OFF	Multi-segment command 0	F4-01
OFF	OFF	ON	Multi-segment command 1	F4-02
OFF	ON	OFF	Multi-segment command 2	F4-03
OFF	ON	ON	Multi-segment command 3	F4-04
ON	OFF	OFF	Multi-segment command 4	F4-05
ON	OFF	ON	Multi-segment command 5	F4-06
ON	ON	OFF	Multi-segment command 6	F4-07
ON	ON	ON	Multi-segment command 7	F4-08

When the frequency source is multi-speed, the function code F4-01-F4-07 can directly set the frequency value of multi-speed. In addition to the multi-segment speed function, multi-segment command can also be used as a given source of PID, or as a voltage source of V/F separation control, etc., to meet the need of switching between different given values.

4.2.3 Application of Inverter Constant Pressure Water Supply Function

(Mini type inverter)

Parameter settings:

F0-00=0 or 1 (Panel or external terminal starts)

F0-01=6 (Constant pressure water supply function mode)

F5-02=0 or 1 (PID feedback source, 0 is generally connected to the remote pressure gauge, and 1 is generally connected to the pressure sensor)

F5-08=0/1/2/3 (Sensor type selection, $0:0^{10}$ V input can be selected; $1:4^{20}$ mA input; $2:0^{5}$ V input; 3:0.5V $^{4}.5$ V input)

F5-09 (Sensor range)

4.2.4 Application of Multi-inverter Network Function (Taking three inverters as an example)

1. Three inverters network, multi-pump master and slave control mode

Parameters setting:

Master	Slave 1	Slave 2
F0-26=3 (3 inverters network master setting) F5-32=0(multi-pump master and slave control) F5-37(adding pump frequency) F5-38(under-pressure adding pump time) F5-39(reducing pump frequency) F5-40(over-pressure reducing pump time)	F0-26=11 (slave 1 in the network setting)	F0-26=12 (slave 2 in the network setting)

2. Three inverters network, multi-pump synchronous control mode

Parameters setting:

Master	Slave 1	Slave 2
F0-26=3(3 inverters network master setting)	F0-26=11	F0-26=12
F5-32=1(multi-pump synchronous control)	(slave 1 in the	(slave 2 in the network setting)
F5-35(alternating pump period)	network setting)	

3. Three inverters network, multi-pump one for use one for standby control mode Parameters setting:

Master	Slave 1	Slave 2
F0-26=3(3 inverters network master	F0-26=11	F0-26=12
setting)	(slave 1 in the	(slave 2 in the network
F5-32=2(multi-pump one for use one for	network setting)	setting)
standby control)		

4. Three inverters network, standby master running mode; This function is applicable to any of the above three modes; Only slave 1 can be set as the standby master

Parameters setting:

Master	Slave 1	Slave 2
F0-26=3	F0-26=11(slave 1 in the network setting)	F0-26=12
(3 inverters network	F5-33=0/1/2(0: The standby master controls	(slave 2 in the network
master setting)	other slaves in the network stop together	setting)
F5-32=0/1/2	1: The standby master controls other slaves in	
	the network run as the F5-34 setting	
	frequency at constant speed	
	2: The standby master controls other slaves in	
	the network run at constant pressure(This	
	mode requires the standby master to connect	
	to the pressure sensor)	
	F5-34(Standby master running frequency)	
	F5-46=1(Standby master and slave quantity)	

4.2.5 Application of one inverter controls multiple pumps

1. Two pumps alternate mode

Parameters setting:

F0-26=07(Two pumps alternate automatically)

F5-35(Alternating pump period)

F5-37(Adding pump frequency)

F5-38(Under-pressure adding pump time)

F5-39(Reducing pump frequency)

F5-40(Over-pressure reducing pump time)

F5-45=1(Number of pumps running at the same time)

2. Fix one pump for inverter mode(The wiring diagram takes one for inverter, three for grid power as an example)

Parameters setting:

F0-26=17/18/19(17: One for inverter, one for grid power(Fix pump 1 for inverter, pump 2 for grid power, do not alternate; 18: One for inverter, two for grid power(Fix pump 1 for inverter, pump 3 for grid power, do not alternate; 19: One for inverter, three for power conversion(Fix pump 1 for inverter, pump 2/3/4 for power frequency, don't alternate)

F5-37(Adding pump frequency)

F5-38(Under-pressure adding pump time)

F5-39(Reducing pump frequency)

F5-40(Over-pressure reducing pump time)

Chapter 5 Parameters

The symbols in the function code table are described as follows:

- "☆": The parameter can be modified when the inverter is in either stop or running state.
- "★": The parameter cannot be modified when the inverter is in the running state.
- "●": The parameter is the measured value in real-time and cannot be modified.
- "*": The parameter is factory parameter and can be set only by the manufacturer, not available for user.
- "▲": The parameter is factory parameter and can be set only by the manufacturer, not available for user.

5.1 Parameters Overview

Function Code	Name	Function Code	Name
F0-00	Command source selection	F0-14	Running direction
F0-01	Main frequency source selection	F0-15	Speed tracking start
F0-02	Auxiliary frequency source selection	F0-16	Preset frequency
F0-03	Frequency source selection	F0-17	Running action frequency below lower limit frequency
F0-04	Acceleration time	F0-18	Command source & frequency source binding
F0-05	Deceleration time	F0-19	JOG/REV key function selection
F0-06	DC output selection	F0-20	STOP key function
F0-07	Analog input/output signal format	F0-21	Jog running frequency
F0-08	Halt mode	F0-22	Jog acceleration time
F0-09	Upper limit frequency preset	F0-23	Jog deceleration time
F0-10	Lower limit frequency preset	F0-24	Restore factory parameters
F0-11	Torque boost	F0-25	Select display menu type
F0-12	Torque boost cut-off frequency	F0-26	Water pump running mode
F0-13	Carrier frequency		
Function Code	Name	Function Code	Name
F1-00	DI1 terminal function selection	F1-18	Relay output current reaches 2 set value
F1-01	DI2 terminal function selection	F1-19	Relay output current reaches 2 bandwidth
F1-02	DI3 terminal function selection	F1-20	Relay1 output delay time
F1-03	DI4 terminal function selection	F1-21	Relay2 output delay time
F1-04	DI5 terminal function selection	F1-22	DO1 output delay time
F1-05	DI1~DI5 terminal valid mode selection	F1-23	DO2 output delay time
F1-06	Terminal command mode	F1-24	Al1 gain

F1-07	Relay terminal valid state selection	F1-25	AI1 offset
F1-08	Relay1 function selection	F1-26	AI2 gain
F1-09	Relay2 function selection	F1-27	AI2 offset
F1-10	DO1 output function selection(collector output)	F1-28	AO1 output function selection
F1-11	DO2 output function selection(collector output)	F1-29	AO2 output function selection
F1-12	Relay output frequency reaches 1 set value	F1-30	AO1 gain
F1-13	Relay output frequency reaches 1 bandwidth	F1-31	AO1 offset
F1-14	Relay output frequency reaches 2 set value	F1-32	AO2 gain
F1-15	Relay output frequency reaches 2 bandwidth	F1-33	AO2 offset
F1-16	Relay output current reaches 1 set value	F1-34	DI delay time
F1-17	Relay output current reaches 1 bandwidth		
Function	Name	Function	Name
Code	Hame	Code	Nume
F2-00	V/F curve setting	F2-11	VF over-current stall action current

F0-09	Frequency Upper limit Inverter maximum output fre	F0-10	50.0	599.9	Hz	☆
F0-10	Frequency Lower limit Inverter minimum output free	0.0	0.0	F0-09	Hz	☆
F0-11	Torque Boost	0	Depends on model	30.0	%	☆
	Under the V/F control mode, the output torque of the motor is relatively low in la frequency operation, which can increase the value of this parameter; However, to boost setting is too large, the motor is easy to overheat, and the inverter is easy overcurrent. When the load is heavy and the starting torque of the motor is insufficient, it is recommended to increase this parameter. When the load is light, the torque can reduced.					
F0-12	Torque Boost Cut-off Frequency	0.0	50.0	F8-03	Hz	*

	Below this frequency, the torque boost fails.	que boost is	effective, and	beyond this	set freque	ncy, the

F1-08	Relay 1 Output Function			_					
	Selection	0	1	27	-	\Rightarrow			
	<u> </u>	1	L	1	L	I			

The output terminal of each relay can provide 27 kinds of functions, these functions are:

- 0: No function.
- **1. The inverter is running.** The inverter is in the running state, and when there is an output frequency (which can be zero), it outputs the ON signal.
- **2: Inverter fault.** When the inverter fails and stops, it outputs the ON signal.
- **3: Ready for running.** When the power supply of the main circuit and control circuit of the inverter is stable, and the inverter does not detect any fault information, and the inverter is in an operational state, the ON signal is output.
- **4:** The upper limit frequency arrives. When the operating frequency reaches the upper limit frequency, the ON signal is output.
- **5: The lower limit frequency arrives.** When the operating frequency reaches the lower limit frequency, the ON signal is output. This signal is OFF in the stop state.
- **6: Torque limit.** In the speed control mode of the inverter, when the output torque reaches the torque limit, the inverter is in the stall protection state and outputs the ON signal at the same time.
- **7. Communication control.** The relay output is controlled by Modbus RTU (RS485).
- 8: Motor overload pre-alarm. Output ON signal before motor overload protection action.
- **9: Inverter overload pre-alarm.** Output the ON signal 10s before the overload protection of the inverter occurs.
- **10: Timed time exceeded.** When the running time of the inverter reaches the set timing time (F6-05), it outputs the ON signal.
- **11: The frequency reaches 1.** When the operating frequency of the inverter reaches the set value of F1-12, it outputs the ON signal.
- **12: The frequency reaches 2.** When the operating frequency of the inverter reaches the set value of F1-14, it outputs the ON signal.
- **13: The current reaches 1.** When the running current of the inverter reaches the set value of F1-16, it outputs the ON signal.
- **14: The current reaches 2.** When the running current of the inverter reaches the set value of F1-18, the ON signal is output.
- 15: Al1 input exceeds the upper or lower limits.
- 16~19: Reserved
- **20:** Pump 1 runs in inverter mode. Water supply mode judges pump 1 runs in inverter mode, output ON signal
- **21: Pump 1 runs in grid power mode.** Water supply mode judges pump 1 runs in grid power mode, output ON signal
- **22: Pump 2 runs in inverter mode.** Water supply mode judges pump 2 runs in inverter mode, output ON signal
- **23: Pump 2 runs in grid power mode.** Water supply mode judges pump 2 runs in grid power mode, output ON signal
- **24: Pump 3 runs in inverter mode.** Water supply mode judges pump 3 runs in inverter mode, output ON signal
- **25: Pump 3 runs in grid power mode.** Water supply mode judges pump 3 runs in grid power mode, output ON signal
- **26: Pump 4 runs in inverter mode.** Water supply mode judges pump 4 runs in inverter mode, output ON signal

F2-06	Multi-point VF Voltage Point 3	0	0	100.0	%	*
F2-07	Multi-point VF Frequency Point 4	F2-05	0	F2-09	Hz	*
F2-08	Multi-point VF Voltage Point 4	0	0	100.0	%	*
F2-09	Multi-point VF Frequency Point 5	F2-07	0	F0-09	Hz	*
F2-10	Multi-point VF Voltage Point 5	0	0.0	100.0	%	*
	Voltage relationship: the voltage reasonably according to the load Frequency relationship: the must four-segment frequency > three one-segment frequency. Multi-point VF should be set according to the low-frequency voltage and the inverter may be over-re-	nd characterish of the condition of the conding to the conding to the condition of the cond	stics. curve of five equency > to see load chara nigh, the mo	e-segment fre wo-segment f acteristics of f tor may over	equency > frequency the motor	>
F2-11	VF Over-current Stall Action Current	50	150	200	%	*
F2-12	VF Over-current Stall Enable	0	1	1	-	*
	0: Disable 1: Enable					
F2-13	VF Over-current Stall Inhibition Gain	0	20	100	-	☆
F2-14	VF Multiple Over-current Stall Action Current Compensation	50	50	200	-	*

	under the same stall current, me characteristics of the motor, can some centrifuge such as running and load the occasion of mome acceleration.	n reduce the g frequency	rated freque	ency above st ed several tir	tall current	action, in eakening		
F2-15	VF Overexcitation Gain	0	64	200	-	☆		
	In the process of inverter deceleration, over magnetizing control can restrain the rise of bus voltage and avoid overvoltage fault. The greater the over magnetizing gain, the stronger the inhibition effect. When the inverter is prone to overvoltage alarm during deceleration, it is necessary to increase the over magnetizing gain. However, the over magnetizing gain is too large, which easily leads to the increase of output current, so it needs to be weighed in application. When the inertia is small, there will be no voltage rise during motor deceleration, so it is recommended to set the over magnetizing gain to 0. To places that have requirements of							
	braking resistor, also suggested that over magnetizing gain is set to 0.							
F2-16	VF Overvoltage Stall Action Voltage	200.0	Depend on model	2000.0	V	*		
	VF overvoltage stall running voltage.							
F2-17	VF Overvoltage Stall Enable	0	1	1	-	*		
	0: Disable 1: Enable							
F2-18	VF Overvoltage Stall Inhibition Frequency Gain	0	30	100	-	☆		
	Increasing F2-18 will improve the control effect of DC bus voltage, but the output frequency will fluctuate. If the output frequency fluctuates greatly, F2-18 can be appropriately reduced.							
F2-19	VF Overvoltage Stall Inhibition Voltage Gain	0	30	100	-	☆		
	Increasing F2-19 can reduce the	e overshoot o	of DC bus vo	ltage.	1			
F2-20	Maximum Rising Limiting Frequency of Overpressure Stall	0	5	50	Hz	*		
	Limit of maximum rising frequency of overvoltage inhibition.

5.2.10 F9 Parameter Group – Motor Control Advanced Parameter

Parameter	Description	Minimum Value	Default Value	Maximum Value	Unit	Change Permission			
F9-00	High Speed Area Switching Frequency	F9-03	10.0	F8-03	Hz	☆			
	When the running frequency is greater than this value, the speed loop PID parameter is selected as the speed loop parameter in the high-speed segment. Running frequency between high speed and low speed, the speed loop PID parameter linear transformatic of two sets of PID parameters.								
F9-01	High Speed Area Proportional Gain	1	20	100	-	☆			
	Setting the proportional coefficient of the speed regulator can adjust the speed dynamic response characteristics of vector control. Increasing the proportional gain can speed up the dynamic response of the speed loop, but excessive proportional gain may make the system oscillate. Note: The parameters of high-speed area and low-speed area are only valid when F8-06 selects vector control.								
F9-02	High Speed Area Integral Time Constant	0.01	1.00	10.00	secon d	☆			
	The speed dynamic response characteristic of vector control can be adjusted by sintegral time of the speed regulator. Shortening the integral time can accelerate dynamic response of the speed loop, but too short integral time may make the socillate.								
F9-03	Low Speed Area Switching Frequency	0.0	5.0	F9-00	Hz	☆			
	When the operating frequence parameters of speed loop.	y is less than	this value, F9	0-04 and F9-0!	5 are sele	cted as PID			
F9-04	Low Speed Area Proportional Gain	1	30	100	-	☆			
	The inverter runs at different frequencies and can select different speed loop PID parameters. When the running frequency is less than the switching frequency of the low-speed segment F9-03, the proportional gain of the speed loop is used.								
F9-05	Low Speed Area Integral Time Constant	0.01	0.50	10.00	secon d	☆			
	When the operating frequency is less than the switching frequency F9-03 in the low-speed section, the value of this parameter is used for the speed loop integral time.								
F9-06	Speed Loop Filter Time Constant	0.000	0.200	1.000	secon d	☆			
	This parameter generally does not need to be adjusted, and the filtering time can be appropriately increased when the speed fluctuation is large. If the motor oscillates, the parameter should be appropriately reduced. The speed loop filter time constant is small, and the output torque of a inverter may fluctuate greatly, but the response speed is fast.								

F9-07	Slip Compensation Coefficient	50	100	200	%	☆					
	accuracy of the motor: when t	For speed sensorless vector control, this parameter is used to adjust the steady speed accuracy of the motor: when the motor has a low speed, increase this parameter, and vice versa. With vector control of speed sensor, this parameter can adjust the output current of									
	down-converter with the same	e load.									
F9-08	Maximum Output Voltage 100 105 110 %										
	the maximum load capacity of ripple will aggravate the moto motor weak magnetic area wi	The maximum output voltage of inverter can be increased. Increasing F9-08 can improve the maximum load capacity of fan weak magnetic area, but the increase of motor current ripple will aggravate the motor heat. On the contrary, the maximum load capacity of motor weak magnetic area will decrease, but the ripple of motor current will reduce the motor heat. Generally, no adjustment is required.									
F9-09	Torque Control Forward Maximum Frequency	0.0	50.0	F0-09	Hz	☆					
F9-10	Torque Control Reverse Maximum Frequency	0.0	50.0	F0-09	Hz	☆					
	must be limited. If it is necessary to change the	e maximum to			If it is necessary to change the maximum torque control frequency dynamically, the upper

Chapter 6 Communication

6.1 Modbus-RTU Communication Protocol

The controller can read consecutive addresses at one time, with a maximum of 12 addresses, but it should be noted that it cannot exceed the last address, otherwise it will make an error. The read operation command is 0x03; The write command is 0x06, which does not support reading and writing of bytes or bits.

6.2 Modbus Register Definition

Register Number	Function Code Parameter	Function Code	Function	Range	Description
0x01	-	06/03	Set communication frequency	-10000~10000	10000 refers to 100% corresponding to the maximum frequency, 0 refers to 0% corresponding to the minimum frequency, when set to negative direction.
0x02	1	06	Control command	1~7	 forward running reverse running forward jogging reverse jogging free stop ramp to stop fault reset
0x03	-	06	Relay control	0x00~0x0F	BIT0: relay 1 control; BIT1: relay 2 control BIT2: DO1 control; BIT3: DO2 control
0x04	-	06	AO1 output control	0∼7FFF	0 corresponding output 0%, 7FFF corresponding output 100%
0x05	-	06	AO2 output control	0∼7FFF	0 corresponding output 0%, 7FFF corresponding output 100%
0xF000	F0-00	03	Command source	0~2	Refer to F0-00
				•	
0xF924	F9-36	03	Synchronous motor tuning time current loop Ki adjustment coefficient	Depend on inverter model	Refer to F9-36
0x1000	U0-00	03		Refer to	U0-00
0x1047	U0-71	03		Refer to	U0-71

All user-configurable parameters can be read or written from the hold register by the appropriate Modbus command. The register numbers of parameters F0-00 to F9-40 are defined as 0xF001 to 0xF928. The register numbers of parameters U0-00 to U0-71 are defined as 0x1000 to 0x1047.

6.3 Modbus Application Cases

6.3.1 Setting Communication Parameters

During MODBUS communication, you need to set relevant parameters first, and they can be set in F7 parameter group.

Parameter	Name	Description			
F7-00	Inverter address	The local address of the inverter when it uses the communication function. If the value is set to 0, the broadcast address is used to implement the broadcast function of the upper computer.			
F7-01	Baud Rate	0: 9600BPS 1: 19200BPS 2: 38400BPS 3: 57600BPS 4: 115200BPS			
F7-02	Data Format	0: No verification (8-N-2) 1: even check (8-E-1) 2: Odd check (8-O-1) 3: No verification (8-N-1)			
F7-03	When this parameter is set to 0.0 second, no communication timeout detection is performed. When this parameter is set to more than 0.1 second, if the interval between one communication and the next communication exceeds the communication timeout, the inverter will report a communication failure (Err16).				

6.3.2 Enable Communication Function

Parameter	Set Value	Function
F0-00: Command Mode	2	The start-stop control mode of an inverter is set as communication control. The controller writes the number "1~5" to register no.2 to control the start-stop command executed by the inverter. See Section 6.2 for the specific command.
F0-01: Target Frequency Setting Mode	8	The target frequency setting mode of an inverter is communication setting. The controller can control the target frequency of an inverter by writing the number "-10000~10000" to register No. 1. For specific command, see Section 6.2.
F1-08: Relay Output Selection	7	The inverter relay is set for communication control, and the controller writes the number "0 or 1" into the No.3 register, which can control the closing and opening of the relay.
F1-28: AO1/AO2 Output Selection 6		The analog output terminal of the inverter is set as communication control, and the controller writes numbers "0~7FFF" to register no. 4, where 0 corresponds to 0% output and 7FFF to 100% output.
F5-00: PID Setting Source F5-02: PID Feedback Source 4/2		The Modbus register No.1 of the inverter is enabled at this time, and its value is used as the given value or feedback value of PID.

Chapter 7 Maintenance and Troubleshooting

7.1 Routine Maintenance

7.1.1 Regular Inspection

Due to the influence of environmental temperature, humidity, dust and vibration, the internal devices of the inverter will be aged, resulting in potential failures of the inverter or reducing the service life of the inverter. Therefore, it is necessary to carry out daily and regular maintenance of the inverter.

<u>,</u>		
Daily Inspection Items	Regular Inspection Items	
▲ Whether the sound of the motor changes	▲ Check whether the air channel is clean	
abnormally or vibrates during running.		
▲ Does the installation environment of inverter	▲ Check whether the screws are loose.	
change.	▲ Check whether the screws are loose.	
▲ Whether the cooling fan of the inverter works	▲ Check whether the inverter is corroded.	
normally and whether there are stains.	Check whether the inverter is corroded.	
A Is the inverter everbeated	▲ Check the wiring terminals for traces of arcing	
▲ Is the inverter overheated.	pulling.	
▲ Is the inverter kept clean.		

7.1.2 Long-time Storage

If the inverter has been stored for a period of time before installation or has not been powered by the main power supply for a long time, it is necessary to age and energize the DC capacitor in the inverter according to the following instructions before operation, and the inverter can run normally after the aging is completed.

Storage	Input	Duration 1	Input	Duration 2	Input	Duration 2	Input	Duration 4
Time	Voltage 1	Duration 1	Voltage 2	Duration 2	Voltage 3	Duration 3	Voltage 4	Duration 4
Less than 1	100%			Wit	hout treatm	ent		
year								
1-2 years	100%	1 hour			Normal	running		
2~3 years	25%	0.5 hour	50%	0.5 hour	75%	0.5 hour	100%	0.5 hour
More than 3 years	25%	2 hours	50%	2 hours	75%	2 hours	100%	2 hours

7.2 Faults and Solutions

If the inverter system fails during operation, the inverter will stop output immediately to protect the motor. At the same time, the inverter fault relay acts. The inverter panel displays fault codes. The following table lists the fault types and common solutions corresponding to the fault codes.

The list in the table is for reference only. Do not repair or modify it without authorization. If you can't troubleshoot, please ask the supplier for technical support.

Fault Name	Display	Possible Causes	Solutions
Inverter Unit Protection	Err01	 The output circuit is grounded or short circuited The connecting cable of the motor is too long The module overheats The internal connections become loose The main control board is faulty The drive board is faulty The inverter module is faulty 	 Eliminate external faults Install a reactor or an output filter Check the air filter and the cooling fan Connect all cables properly Contact for technical support Contact for technical support Contact for technical support Contact for technical support
Overcurrent During Acceleration	Err02	 The output circuit is grounded or short circuited The control method is vector and no parameter identification The acceleration time is too short Manual torque boost or V/F curve is not appropriate The voltage is too low The startup operation is performed on the rotating motor. A sudden load is added during acceleration The inverter model is of too small power class 	 Eliminate external faults Perform the motor auto-tuning Increase the acceleration time Adjust the manual torque boost or V/F curve Adjust the voltage to normal range Select rotational speed tracking restart or start the motor after it stops Remove the added load. Select higher power rating inverter
Overcurrent During Deceleration	Err03	1. The output circuit is grounded or short circuited 2. The control method is vector and no parameter identification 3. The deceleration time is too short 4. The voltage is too low 5. A sudden load is added during deceleration 6. The braking unit and braking resistor are not installed	 Eliminate external faults Perform the motor auto-tuning Increase the deceleration time Adjust the voltage to normal range Remove the added load. Install the braking unit and braking resistor

Fault Name	Display	Possible Causes	Solutions
Overcurrent at Constant Speed	Err04	1. The output circuit is grounded or short circuited 2. The control method is vector and no parameter identification 3. The voltage is too low 4. A sudden load is added during deceleration 5. The inverter model is of too small power class	 Eliminate external faults Perform the motor auto-tuning Adjust the voltage to normal range Remove the added load. Select higher power rating inverter
Overvoltage During Acceleration	Err05	 The input voltage is too high An external force drives the motor during acceleration The acceleration time is too short The braking unit and braking resistor are not installed 	 Adjust the voltage to normal range Cancel the external force or install a braking resistor Increase the acceleration time Install the braking unit and braking resistor
Overvoltage During Deceleration	Err06	 The input voltage is too high An external force drives the motor during deceleration The deceleration time is too short The braking unit and braking resistor are not installed 	 Adjust the voltage to normal range Cancel the external force or install a braking resistor Increase the deceleration time Install the braking unit and braking resistor
Overvoltage at Constant Speed	Err07	 The input voltage is too high An external force drives the motor during running 	 Adjust the voltage to normal range Cancel the external force or install a braking resistor
Control Power Supply Fault	Err08	The input voltage is not within the allowable range	1. Adjust the voltage to normal range
Undervoltage	Err09	1. Instantaneous power failure 2. The inverter's input voltage is not within the allowable range 3. The DC bus voltage is abnormal 4. The rectifier bridge and buffer resistor are faulty 5. The drive board is faulty 6. The main control board is faulty	 Reset the fault Adjust the voltage to normal range Contact for Technical support
Inverter Overload	Err10	 The load is too heavy or locked rotor occurs on the motor The inverter model is of too small power class 	 Reduce the load and check the motor and mechanical condition Select an inverter of higher power class

Fault Name	Display	Possible Causes	Solutions
Motor Overload	Err11	 1. P9-01 is set improperly 2. The load is too heavy or locked rotor occurs on the motor 3. The inverter model is of too small power class 	 Set P9-01 correctly Reduce the load and check the motor and mechanical condition Select higher power rating inverter
Power Input Phase Loss	Err12	 The three-phase power input is abnormal The drive board is faulty The lightening board is faulty The main control board is faulty 	 Eliminate external faults Contact for Technical support Contact for Technical support Contact for Technical support
Power Output Phase Loss	Err13	 The cable connecting the inverter and the motor is faulty The inverter's three-phase outputs are unbalanced when the motor is running The drive board is faulty The module is faulty 	 Eliminate external faults Check whether the motor three-phase winding is normal Contact for Technical support Contact for Technical support
Module Overheat	Err14	 The ambient temperature is too high The air filter is blocked The fan is damaged The thermally sensitive resistor of the module is damaged The inverter module is damaged 	 Lower the ambient temperature Clean the air filter Replace the damaged fan Replace the damaged thermally sensitive resistor Replace the inverter module
External Equipment Fault	Err15	 External fault signal is input via DI External fault signal is input via virtual I/O 	Reset the operation Reset the operation
Communication Fault	Err16	 The controller is in abnormal state The communication cable is faulty The communication parameters are set improperly 	 Check the cabling of host computer Check the communication cabling Set the communication parameters properly
Contactor Fault	Err17	 The drive board and power supply are faulty The contactors is faulty 	 Replace the faulty drive board or power supply board Replace the faulty contactor
Current Detection Fault	Err18	 The HALL device is faulty The drive board is faulty 	 Replace the faulty HALL device Replace the faulty drive board

Fault Name	Display	Possible Causes	Solutions
Motor Auto-tuning Fault	Err19	 The motor parameters are not set according to the nameplate The motor auto-tunning times out 	 Set the motor parameters according to the nameplate properly Check the cable connecting the inverter and the motor
EEPROM Write Fault	Err21	1. The EEPROM chip is damaged	1. Replace the main control board
Inverter Hardware Fault	Err22	1、Overvoltage 2、Overcurrent	Solve as overvoltage fault Solve as overcurrent fault
Short Circuit to Ground	Err23	The motor is short circuited to the ground	1. Replace the cable or motor
Accumulative Running Time Reached	Err26	The accumulative running time reaches the setting value	Clear the record through the parameter initialization function
Accumulative Power-on Time Reached	Err29	The accumulative power-on time reaches the setting value	Clear the record through the parameter initialization function
Pulse-by-pulse Current Limit Fault	Err40	 The load is too heavy or locked rotor occurs on the motor The inverter model is of too small power class 	 Reduce the load and check the motor and mechanical condition Select an inverter of higher power class
Motor Switchover Fault During Running	Err41	Change the selection of the motor via terminal during running of the inverter	Perform motor switchover after the inverter stops
Excessive Speed Deviation Fault	Err42	 Excessive Speed deviation Inspection parameter P6-10, P6-11 Setting is not correct No parameter identification 	 Correctly Setting Parameter P6-10, P6-11. Executive parameter identification
Water Shortage alarm	A52	 Pressure sensor is damaged Check whether the parameters of the inverter are incorrectly set Whether the pipe network and motor are correct 	 Check pressure sensor Check inverter parameter setting Check motor and pipe
Overpressure Fault	Err53	 Pressure sensor is damaged Check whether the parameters of the inverter are incorrectly set 	 check the pressure sensor Test whether the inverter F5-18 is correctly set

7.3 Common Faults and Solutions

The following faults may be encountered during the use of the inverter. Refer to the following table for simple fault analysis:

SN	Fault	Possible Causes	Solutions
1	There is no display at power-on	 There is no power supply to the inverter or the power input to the inverter is too low The power supply of the switch on the drive board of the inverter is faulty The rectifier bridge is damaged The buffer resistor is faulty The control board or the operation panel is faulty The cable connecting the control board and the drive board, and the operation panel breaks 	 Check the power supply Check the DC bus voltage Re-connect the 10-core cables 4~6. Contact us for technical support
2	"Err23" is displayed at power-on	 The motor or the motor output cable is short circuited to the ground The inverter is damaged 	 Measure the insulation of the motor and the output cable with a megger Contact us for technical support
3	Err14 (Module overheat) fault alarm frequently	 The setting of switching frequency is too high The cooling fan is damaged, or the air filter is blocked Components inside the inverter are damaged (thermocouple or other) 	 Reduce the switching frequency (P0-13) Replace the fan and clean the air filter Contact us for technical support
4	The motor does not rotate after the inverter runs	1. Check the motor and the motor cables 2. The inverter parameters are set improperly (Motor parameters) 3. The cable between the drive board and the control board is in poor contact 4. The drive board is faulty	 Ensure the cable between the inverter and the motor is normal Replace the motor or clear mechanical faults Check the re-set motor parameters Contact us for technical support
5	The DI terminals are disabled	 The parameters are set incorrectly The external signal is incorrect The control board is faulty 	 Check and reset the parameters in group P4 Re-connect the external signal cables Contact us for technical support

SN	Fault	Possible Causes	Solutions
6	The inverter overcurrent and overvoltage frequently	 The motor parameters are set improperly The acceleration/deceleration time is improper The load fluctuates 	 Re-set motor parameters or re-perform the motor auto-tunning Set proper acceleration/deceleration time Contact us for technical support
7	Err17 alarm when power-on or running	The soft startup contactor is not picked up	 Check whether the contactor cable is loose Check whether the contactor is faulty Check whether 24V power supply of the contactor is faulty Contact us for technical support

7.4 Warranty Agreement

- (1) Free warranty only refers to the inverter itself.
- (2) In case of failure or damage within the warranty terms, our company is responsible for 12 months warranty (from the date of delivery, the bar code on the fuselage shall prevail, and if there is a contract agreement, it shall be implemented according to the agreement). For more than 12 months, we will charge a reasonable maintenance fee;
- (3) During the warranty period, our company will charge a certain maintenance fee if:
 - a) Machine damage caused by the user's failure to comply with the regulations in the user manual;
 - b) Machine damage caused by mistakes in use and unauthorized maintenance and modification;
 - c) Damage caused by fire, flood, abnormal voltage, etc.;
 - d) Damage caused by using the inverter for abnormal functions;
 - e) Damage caused by man-made falling and transportation after purchase;
 - f) Failure and damage caused by obstacles outside the machine (such as external equipment factors);
- (4) The service fee is calculated according to the uniform standard of the manufacturer. If there is a contract, the contract will take precedence.
- (5) If there is any problem in the service process, please contact the supplier in time.
- (6) The final interpretation right of warranty instructions belongs to our company.
